MANNASEED

Hidden Provision. Eternal Word.

PROJECT WHITEPAPER

Version 1.3 — April 2026

Open Source · Free Forever

"Heaven and earth will pass away, but my words will never pass away."

— Matthew 24:35

Summary

MannaSeed is a contingency — software that lets a believer carry the complete King James Bible through any checkpoint, on any device, leaving no trace that any forensic tool can find. It is not a Bible app. It is what a Bible app would look like if it had to survive in a country that had banned the Bible.

The software is disguised as a calculator. Access is controlled by a twelve-word seed phrase the user has memorized. The Bible decrypts entirely in device memory and is gone the moment the session ends. A full forensic extraction of the device finds nothing.

Alongside the app, all 66 books of the King James Bible have been permanently inscribed on the Bitcoin blockchain as of April 25, 2026. These inscriptions are not part of the app — they are a companion project, accessible through a dedicated website. As long as Bitcoin exists, the Word of God exists on it, retrievable by anyone with the transaction ID.

Both the app and the inscriptions are open source and free forever. There is no company, no fundraising, no profit motive. The Bible text is public domain. The cryptography is standard. Everything is verifiable and reproducible by anyone.

The Name

"I will give to the one who is victorious some of the hidden manna."

— Revelation 2:17

In the wilderness, God fed His people with something that appeared each morning, unexplained, unearned, sufficient for the day. It came quietly, in the dark of night. It could not be stockpiled — only received, daily, in dependence on the One who sent it.

Manna was the provision. The seed phrase is the seed. MannaSeed is both — the hidden provision and the key that unlocks it, held in memory, carried through any checkpoint, plantable in any soil.

To a law enforcement officer scanning a phone, MannaSeed is a calculator app. To a forensic tool extracting device contents, it is an encrypted file of indeterminate purpose. To a believer in a country that has banned the Bible, it is exactly what the word has always meant.

MannaSeed is the name of the project, not the name of the app. The installed app is called whatever its builder chooses: "Calculator," "Unit Converter," "Tip Tool." A name that raises no eyebrow on any device scan.

1. Why This Exists

MannaSeed was inspired by Disciples in the Moonlight, a 2024 film in which seven believers smuggle Bibles to underground churches in a near-future America that has outlawed scripture. One scene depicts a young woman having her phone scanned in a diner and being arrested for the biblical content found on it.

That scene is not science fiction. Forensic platforms used by law enforcement worldwide can extract a device's complete contents in minutes — every app, every cached file, every deleted message. Every existing Bible app stores recoverable data: downloaded chapters, reading history, account tokens. All of it is findable. All of it can be used as evidence.

Believers in China, North Korea, Iran, and elsewhere already live this scenario. They need a tool like this today. Americans do not need it yet — but the time to build the shelter is before the storm. Any software that stores Bible text on a device, in any form, is a liability the moment that device is seized. The only safe Bible is one that leaves no trace when it is not being actively read.

2. What MannaSeed Is

MannaSeed is a piece of software, disguised as a calculator, that provides access to the complete King James Bible entirely offline. The Bible decrypts from an AES-256-GCM encrypted binary embedded in the app, into device RAM only, using a key derived from a seed phrase the user has memorized. No network request is ever made. No file is ever written. No cache is ever touched.

When the session ends — by pressing the power button, by closing the app, or after sixty seconds of idle time — the decrypted text is zero-filled from memory. What remains on the device is an encrypted binary indistinguishable from random data. Without the correct key, which exists only in the user's memory, it cannot be identified as scripture.

MannaSeed is designed to be distributed before it is needed, on every medium that can carry a file: USB drives, microSD cards, CDs, DVDs, floppy disks, Bluetooth, Airdrop, email, printed QR codes. The strategy is abundance — to make the Bible so widely and quietly distributed that any effort to suppress it becomes impossible before it begins.

3. Three Formats, One Cryptographic Core

MannaSeed will be delivered in three formats. All three share the same seed phrase system, the same AES-256-GCM encryption, the same decoy mechanic, and the same Bible text. A seed phrase configured in one format works identically in the others. Twelve words memorized today open the Bible on a USB drive tomorrow, an iPhone next year, or an Android phone in a country that no longer permits open Christianity.

Format	Description
HTML file	Single self-contained file under 1.4 MB. Opens in any browser — no installation, no app store, no account. Fits on every physical medium including a 3.5-inch floppy. Phase 1.
iOS native app	Swift calculator. Secure Enclave hardware-backed crypto. RAM never paged to disk. Sideload only — no App Store. Phase 2.
Android native app	Kotlin calculator. Hardware Keystore / Strongbox where available. APK sideload — no Google Play required. Phase 3.

The HTML file is the priority. It works everywhere immediately, requires nothing from the user beyond a browser, and can be distributed by any means a file can travel. Native apps extend reach to platforms where a browser-based app has limitations.

4. User Flow

4.1 First Launch

- App opens as a fully functional calculator.
- User creates a formula-based PIN — any arithmetic sequence they choose, entered on the calculator keypad (e.g. 2+2×4=). The keypress sequence is hashed with SHA-256 and stored. The sequence itself is never stored.
- User selects one or more decoy methods (see Section 6).
- User generates and writes down a 12-word BIP39 seed phrase. Verifies by re-entering all 12 words before setup completes.

4.2 Every Subsequent Session

- User opens the app. Sees a calculator.
- User enters their formula PIN. If correct, seed phrase entry opens silently. If incorrect, the calculator continues normally — no error, no lockout, no indication anything was attempted.
- User enters their seed phrase. Decoy phrase → personal journal opens. Real phrase → Bible opens.
- User reads.
- Power button ends the session immediately. Memory cleared. Calculator face restored. Nothing remains on the device.

5. The Seed Phrase System

Access to the Bible is controlled by a twelve-word seed phrase generated using BIP39 — the same standard Bitcoin hardware wallets use to protect billions of dollars in assets. The device's hardware random number generator produces 128 bits of entropy, converted deterministically into twelve words from a standardized 2,048-word list.

The same twelve words, on any device running MannaSeed, always produce the same decryption key. No server. No database. No account. Pure mathematics, reproducible by any person who holds those twelve words in memory.

The twelve words must be entered in full on every reading session. There is no saved session, no biometric shortcut, no PIN re-entry window. Any system that saves a session key creates a recoverable artifact on the device. The friction of re-entry is the price of the protection.

Entry is assisted by BIP39 prefix completion — every word is uniquely identified by its first four letters, so the full twelve words can be entered in under thirty seconds. Any typo is caught immediately by the autocomplete rather than producing a silent decryption failure.

6. The Decoy System

The decoy system is what makes MannaSeed safe to carry where carriers can be stopped and compelled to demonstrate their devices. The principle: even if an authority knows this software exists, understands exactly how it works, and requires the user to open it in front of them — they find nothing incriminating.

When opened with decoy credentials, MannaSeed displays a personal journal pre-populated with realistic, neutral content. There is no religious content. An investigator who forces its demonstration finds a boring personal organizer.

Method	Mechanism
Method 1 — Secret word	The 12 words on paper open the decoy. The same 12 words plus one additional word held only in memory open the Bible. The passphrase produces a completely different decryption key and cannot be extracted by any forensic tool because it exists only in a human mind.
Method 2 — Separate phrase	Two completely independent twelve-word phrases. The first is written on paper and opens the decoy. The second is memorized only — never written, never stored anywhere.
Method 3 — Reversed order	The same twelve words entered forward (1→12) open the decoy. Entered in reverse (12→1) they open the Bible. BIP39 is order-sensitive — reordering produces an unrelated key. The paper is real and not incriminating. The direction is the secret.

Methods may be combined. Each additional method multiplies the investigator's burden.

7. Calculator Surface and Kill Switch

MannaSeed presents to the world as a fully functional calculator — not a calculator-themed splash screen over a Bible app, but a real, working calculator that performs arithmetic correctly. The hidden interface is accessed by entering the user's chosen formula sequence. It looks like someone checking their math. There is no visible prompt, no password dialog, no indicator that anything has happened.

The phone's power button is the kill switch. Pressing it locks the device, terminates the session, and resets the display to the calculator face. The seed phrase, the derived key, and the decrypted Bible text are zero-filled from memory in milliseconds. Using the device's own power button — rather than a dedicated in-app button — makes the gesture indistinguishable from the most natural thing a person can do when they sense they are being observed.

Two additional protections run continuously. Every mobile OS captures a screenshot when an app moves to the background; MannaSeed intercepts this event and substitutes a blank calculator image, so the forensically recoverable screenshot shows a calculator. And if the app sits open for sixty seconds unattended, the session terminates automatically.

8. What an Investigator Finds

After a session has ended, a complete forensic extraction of the device finds an encrypted binary blob indistinguishable from compressed application data. There is no Bible text in any readable form, no religious keywords, no network logs, no account credentials, no reading history. Without the correct key — which exists only in the user's memory — the content is random noise.

Under compelled demonstration, the user enters the formula PIN and the decoy phrase. The journal opens. The officer reviews a personal organizer containing nothing incriminating. The user has not lied. The software has shown exactly what it shows when accessed with those credentials.

Honest limitations

- Memory forensics on a live, actively running session could theoretically recover in-RAM content. The kill switch must be used before surrendering the device.
- A passphrase consisting of a single common dictionary word can be brute-forced if an attacker has the twelve-word seed. The secret word should be a phrase, a name, or include numbers.
- Method 3 is the weakest against an investigator who tries both directions. Highest-risk environments should use Method 1 or 2.
- If real credentials are forgotten, the Bible cannot be recovered. Any recovery mechanism would create a recoverable artifact, defeating the security model.

9. Technical Summary

Property	Specification
File format	Single HTML file — runs in any modern browser
Target file size	Under 1.4 MB
Bible content	King James Version, complete OT and NT, 31,102 verses, 66 books
Bible encoding	Plain UTF-8 text, compressed, encrypted with AES-256-GCM
Entropy source	Web Cryptography API — hardware-backed
Seed phrase standard	BIP39 — 128-bit entropy, 12 words, English wordlist, checksum verified
Key derivation	PBKDF2-HMAC-SHA512, 2,048 iterations
Encryption	AES-256-GCM — authenticated encryption, tamper-evident
Passphrase support	BIP39 optional passphrase — any string, never stored
PIN mechanism	User-defined formula sequence, stored as SHA-256 hash only
Session storage	Decrypted Bible text in JavaScript memory only — never written to disk
Memory clearing	Explicit zero-fill of key material and plaintext on session end
Screenshot protection	Page Visibility API — calculator image substituted before OS snapshot
Idle timeout	60 seconds — automatic full session termination
Network access	None — fully offline always
Platform support	Any device with a browser: iOS, Android, Windows, macOS, Linux, Chromebook
License	Open source — MIT or similar permissive license — freely redistributable

10. The Blockchain Bible — A Companion Project

Separate from the MannaSeed app, all 66 books of the King James Bible have been permanently inscribed on the Bitcoin blockchain as individual Ordinal inscriptions — one per book — using Bitcoin's Taproot witness data mechanism. Each inscription is a real Bitcoin transaction, confirmed on-chain, immutable, and permanently retrievable by anyone with the transaction ID.

These inscriptions are not part of the app. They are a companion project with a different purpose: public permanence rather than private protection. Where the app is designed to be invisible, the inscriptions are designed to be verifiable. Anyone in the world can retrieve any book, at any time, with no software beyond a browser and the transaction ID.

All 66 books were inscribed between April 22 and April 25, 2026, at a total cost of approximately $1,130 USD. Each inscription was independently verified: the on-chain content was fetched from a public Ordinals indexer, hashed, and confirmed to match the source byte-for-byte. To the best of public knowledge, this is the first complete, plain-text, book-addressable King James Bible inscribed natively on Bitcoin's base layer.

The complete list of transaction IDs, a public reader, and an independent verification script are available at the companion website:

Blockchainbible.org

No government can remove these inscriptions. No company can take them down. No server can be seized. As long as Bitcoin exists, the Word of God exists on it.

11. Roadmap

Phase 0 — Blockchain Inscriptions ✓ Complete

- All 66 KJV Bible books inscribed as individual Bitcoin Ordinals (April 22–25, 2026)
- All 66 TxIDs verified on-chain via SHA-256 comparison against source manifest
- Total cost: ~1,421,632 sats / ~$1,130 USD
- Companion website and verification script (verify_all.py) published separately

Phase 1 — The HTML File

Single HTML file under 1.4 MB. Fully offline. Calculator surface, formula PIN, BIP39 seed phrase system, three decoy methods, AES-256-GCM encrypted Bible, kill switch, screenshot intercept, 60-second idle timeout. Independent cryptographic security audit before release. Open source from day one.

Phase 2 — iOS Native App

Native Swift calculator with Secure Enclave integration. Sideload only — no App Store. Cross-format seed phrase compatibility verified.

Phase 3 — Android Native App

Native Kotlin calculator with Hardware Keystore / Strongbox. APK sideload — no Google Play required. APK transfer via Bluetooth or SD card built in.

Phase 4 — Content Expansion

Additional public domain translations: ASV, World English Bible, Young's Literal, Darby. Apocrypha for Catholic and Orthodox traditions. Each translation independently encrypted with its own seed phrase.

Phase 5 — Additional Languages

Spanish first. Chinese Simplified next. BIP39 wordlists in corresponding languages. Additional languages based on demand.

Acknowledgments

All credit for this project belongs ultimately to God. He is the author of the Word this software exists to protect. He knows who built it, who helped spread it, who copied it onto a drive and tucked it in a drawer, who passed it to a stranger, who opened it in the dark. That accounting is His, and His alone.

Pastor Allen Nolan — Cornerstone Fellowship

This project exists in part because of the teaching ministry of Pastor Allen Nolan of Cornerstone Fellowship in Tahlequah, Oklahoma. His scripture-based teaching — delivered verse by verse, with depth and clarity, freely available on YouTube — was the instrument God used.

Satoshi Nakamoto and Bitcoin

Satoshi published the Bitcoin whitepaper in 2008 under a pseudonym, built something revolutionary, released it freely to the world, and disappeared. No patent. No profit. No credit claimed. He understood that some things are too important to be owned, too valuable to be controlled, and too necessary to be entrusted to any single authority. He built accordingly. So did MannaSeed.

A Final Word

The Word of God has survived every empire that tried to extinguish it. Every government that tried to silence it has eventually fallen while the Word endured.

This project adds one more layer to that endurance — a small one, a digital one, but one designed for the world as it is becoming. A calculator app no scanner can see through. A blockchain inscription no government can remove. Twelve words, held in memory, that open the complete Word of God on any device, anywhere, leaving nothing behind.

The work is finished. May it never be needed. May it always be ready.

"The grass withers and the flowers fall, but the word of our God endures forever."
— Isaiah 40:8
